# **Specifics Of What Young People Need To Understand Dedicated Servers**

Dedicated servers are the choice of lots of the top web marketers, or webmasters online . They give the owner much more customization, space and are safer than employing a shared server. This implies they can rely solely upon it for their own use. With a large volume of activity for a business this is usually a good way to go.

If you have sorted through many [home business ideas](#) and chose one, then it is a great idea to start by employing a shared sever when you build your first website and need hosting services, but once the site continues to grow larger and larger, and starts to attract many thousands of visitors on an everyday basis, then you'll need to opt for a dedicated server.

Also, if your internet site is really graphic intensive or runs a lost of individualized scripts, then a dedicated server should be your choice form the start. This could give you and your website users a much more delightful online experience, without bandwidth Problems and such like.

With a dedicated server, you'll have much more bandwidth, ram ( random access memory ) and software capacities. It should also cut out plenty of the downtime associated with shared servers, which is terribly annoying to you and your site visitors.

As a lot of the [best home business ideas](#) will tell you, the downtime can happen as many web sites are hosted on once shared account, and the flood of internet site users causes a big strength problem for the server, as such sometimes they aren't able to handle the demand. In this instance you haven't got any control over the quantity of time the server will be down, and you must reply on the owner of the shared server to get your websites back online as fast as attainable.

There are some circumstances where you would like to select a dedicated server in the first example. Such an example would be if you are running an e-commerce website. Sometimes the software used for the ecommerce web site has trouble running on the shared servers. This is because of the shortage of options, both vis software and hardware.

With a dedicated server you have much more micro-management control, as you can set up your own control panel and really customise each step of the process. You can also host as many websites as you wish, so you have control over the likely use of bandwidth, permitting your most popular web sites to be run smoothly.
